The marker protein is preferably a type A beta-lactamase, especially TEM-1 beta-lactamase of Escherichia coli. The oligopeptide is a member of a proteome library selected from single chain antibody Fv fragment library, an antibody light chain variable region library and a peptide library displayed within thioredoxin. The IdEA systems are useful for detecting and identifying interactions between intracellular as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein-protein interaction. The present sequence is Escherichia coli mature TEM-1 beta-lactamase enzyme from plasmid pBR322. TEM-1 beta-lactamase is a product of ampicillin resistance gene. The enzyme has two domains, alpha-omega and mu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Interaction-dependent enzyme association systems for detecting interactions between two or three polypeptides, especially in human therapeutics, diagnostics or prognostics, comprise circularly permutated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Balint RF,

protein interactions in a sample, identifying oligopeptide interactions
between two different proteomes; identifying epitopes that bind to an
immunoglobulin (Ig) variable region, for identifying interactions between
an extracellular domain of a transmembrane protein and a polypeptide, for
high-throughput identification of compounds that inhibit phosphorylation-
regulated signal transducers, forming a enzyme complementation system for
selecting simultaneous incorporation of multiple genetic elements into a
host cell and for activating a beta-lactam derivative of an antitumour
compound in a host who is in need of it. The present sequence represents
the Escherichia coli mature TEM-1 beta-lactamase, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a fragment complementation system (I) which comprises a first oligopeptide (OP1) containing an N-terminal fragment with a C-terminal break point and a second oligopeptide (OP2) comprising a C-terminal with a N-terminal breakpoint, in which the C N terminal fragments are both derived from a marker protein (MP) and reassemble to form a functionally reconstituted MP. Methods from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel fragment complementation system to identify interactions between polypeptides comprises fragment pairs having first and second members that reassemble into a marker protein which has a directly detectable
                                                                                                                                                                                                                                                                                                                                      the Bscherichia coli mature TEM-1 beta-lactamase, exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Balint RF, Her J;

The invention describes a fragment complementation system (I) comprising CC a first oligopeptide having an N-terminal fragment with a C-terminal CC break-point, and a second oligopeptide having a C-terminal fragment with CC a N-terminal break-point, where the N-terminal fragment and the CC terminal fragment each are derived from a marker protein and reassemble CC terminal fragment each are derived from a marker protein and reassemble CC terminal fragment each are derived from a marker protein and reassemble CC selecting simultaneous incorporation of multiple genetic elements into a CC compound in a host. The method described is useful for identifying a Second oligopeptide to which a first oligopeptide binds, involving coccapressing the first and second oligopeptides. Binding of the first CC oligopeptide to the second oligopeptides. Binding of the first CC oligopeptide to the second oligopeptides. Binding of the first CC oligopeptide to the second oligopeptides in the functional CC expressing the occurrence of protein-protein interactions in a sample; CC identifying oligopeptide interactions between two different proteemes; CC identifying epitopes that bind to an immunoglobulin variable region. CC (I) or an expression casette (II), encoding a selectable N or C-terminal CC peptide, is useful for identifying interactions between an extra cellular CC (II) is useful for high-throughput identification of compound that CC (II) is useful for high-throughput for protein, preferably CD40. (I) or an expression casette multiple interaction between extracellular and continued of a transmembrane protein with high throughput format. This is the amino acid contracellular protein with high throughput format. This is the amino acid contracellular protein with high throughput format.
sequence of antibiotic resistance enzyme TEM-1 beta-lactamase that used as a selectable gene in the fragment complementation system o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fragment complementation system for detecting immunoglobulin epitope, has first oligopeptide containing N-terminal fragment with C-terminal breakpoint, second oligopeptide containing C-terminal fragment with N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25-MAY-1999;

                                                                                Escherichia coli beta-lactamase (AAW16634), including the signal peptide, is the expression product of a molecular chimaera, designated pCMV-BL (AAT66737), in which the beta-lactamase gene is under control of the CMV intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or inflammation.

Secretion of the enzyme has the advantage of increasing neighbouring cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Molecular chimaera for gene or virus directed enzyme prodrug therapy useful for treatment of cancer, viral infection or inflammation.

                                                                                                                                                                                                                 The expression constructs pRNH127 and pRNH155 contain identical sequences but were constructed using different strategies (see AAQ36498). The constructs comprise exons 2-7 of human CYP1A1 gene under the construct of the inducible mouse metallothionein (MMT-1) promoter. The constructs also contain an open reading frame in the opposite orientation to the cytochrome P450 exons. This ORF encodes ampicillin resistance. The constructs are suitable for transformation of human fibroblasts derived from the xeroderma pigmentosum group A. Cultures of the transformed fibroblasts can be used to test substances for mutagenicity. The presence of the inducible cytochrome P450 gene allows metabolism of the substance to mutagenic metabolites. (Updated on 10-MAR-2003 to add missing OS

Beta-lactamase delivery to mammalian cells confers sensitivity to cephalosporin prodrugs. Liposomal DNA/5-fluorouracil prodrug combinations resulted in s.c. tumour regression in mice bearing A549 tumours. Survival of mice bearing human large cell lung H460 intrathoracic (i.t.) tumours increased upon i.t. injection of the secretory beta-lactamase DNA was the secretory beta-lactamase DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Molecular chimaera for use in enzyme gene therapy - is activated in a target cell to express a secretable enzyme which cleaves a prodrug outside the cell into a cytotoxic or cytostatic agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is encoded by a chimeric mouse metallothionein-cytochrome P450TA1 (CYPIAI) expression construct. Two clones, pRNH127 and pRNH15 were isolated by different methods and which both had the same sequence. The CYPIAI construct is used in assays to test for cytotoxicity of humans to a chemical. The method comprises exposing human fibroblast cells normally not including any cytochrome P450 activity to potentially coxic chemicals. The cells having been transformed to express cytochrome P450, under the control of a controllable promoter through the CYPIAI gene, upon exposure to the chemical in vitro. The chemical is metabolised intracellularly into a cytochrome metabolite by oxidation within the fibroblasts through the intracellular cytochrome P450 mixed function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oxidase enyzmes expressed by the cells. Gene damage in the test cells is detected as an indication of cytotoxicity of the chemical. (Updated on 2: -MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Testing chemicals for cytotoxicity to human by using recombinant fibroblasts transformed with control of inducible promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 286

Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Intracellular expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or
Prodrug therapy; gene directed virus directed enzyme prodrug
                                         Secretory beta-lactamase.
                                                                 13-AUG-1997
                                                                                                                     AAW18679
                                                                                                                                                                                                                                                                                                                                                                                          Sequence 286 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Molecular chimaera for gene or virus directed enzyme prodrug therapy useful for treatment of cancer, viral infection or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1997-298117/27.

Secretory beta-lactamase constructs, placed under control of promoter/enhancer elements of lung- associated protein or neuroendocrine marker protein genes, can be used in novel chimaeric molecules for use in prodrug therapy of lung cancer

                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel tetracycline assay that uses recombinant CC prokaryotic cells comprising a luciferase gene under the transcriptional CC control of a tetracycline repressor and tetracycline promoter and CC involves the detection of luminescence emitted form the cells. The assay CC can be used to distinguish tetracycline form other microbial agents. The CC can be used to distinguish tetracycline form other microbial agents. The CC can be used to distinguish tetracycline form other microbial agents. The CC can be used to distinguish tetracycline form other microbial agents. The CC can be used to the insect luciferase gene, a tetracycline promoter (TetA) from Tnlo. The tetracycline promoter (TetA) from Tnlo. The tetracycline assay CC method can be used for the determination of tetracycline in a sample, CC e.g. to study the dosage and penetration of the medicine. The method can also be used to test cheese production, as cheese making bacteria are not able to work in the presence of tetracycline. The method can also be used to determine the presence of tetracycline. The method can also be used for the discrobes as do conventional tests, and so is much more rapid. CC e.g. for allergic people. The present assay method does not rely on the growth of microbes as do conventional tests, and so is much more rapid. CC luminescence can be detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAD) which comprises (i) fusing B lymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MFC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of PDGFR (platelet-derived growth factor receptor) CC or CD52. The method is used to select MAD with specificity for particular CC antigens. MAD can be selected without separate culture of hybridomas, and CC election can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex CC mixtures of hybridomas can be used for selection, reducing the time and CC mixtures of hybridomas can be used for selection, reducing the time and CC mixtures of hybridomas can be used for selection, reducing the time and CC motein contained in the expression vector pSEXI5G2 which contains the CC bla protein, Neo-R and protein G described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B Jymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of pogera (platelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and CC selection can be made against many antigens in a library, optionally on CC the basis of strength of affinity for a particular antigen. Complex CC mixtures of hybridomas can be used for selection, reducing the time and CC cost involved in MAb selection. This sequence represents the Neo-R CC protein contained in the expression vector pSEXIII4 which contains the
                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for the selection of monoclonal calls to produce antibody-producing hybridomas such that the antibodies cells to produce antibody-producing hybridomas such that the antibodies care presented at the surface of the hybridomas by an antibody-binding compression (I); and (ii) binding the antibody to antigens (Ag). The combination of the signal peptide of a murine immunoglobulin (Ig) kappa combination or a murine MHC (major histocompatibility complex) Class I k(k) conclude; an antibody-binding site of proteins A, G, L or LG, and the cultivate domain of protein of proteins A, G, L or LG, and the cultivate domain of protein contained antigens which specificity for particular cross-control be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex cost involved in Mab selection. This sequence represents the bla protein contained in the expression vector pSEXIIG2 which contains the invention of the basis of strength of affinity for a particular antigen the bla protein contained in the expression vector pSEXIIG2 which contains the contains the protein of the invention to the contains the protein of the invention to the contains the protein contains the protein of described in the method of the invention to the contains the protein contains the protein of described in the method of the invention to the contains the protein contains the protein of described in the method of the invention to the contains the protein of the invention to the contains the protein of described in the method of the invention to the contains the protein of the invention to the contains the protein of described in the method of the invention to the contains the protein of the invention to the protein of the invention to the contains the protein of the protein of described in the method of the invention to the protein of the

The host cell also contains a second heterologous polynucleotide encoding a secretory polypeptide to facilitate the secretion of the expressed polysaccharase. The recombinant host cell is useful for producing polysaccharase which is useful for enzymatically degrading oligosaccharides such as lignocellulose, hemicellulose, cellulose, pectin or their combinations, and fermenting the product to ethanol, by simultaneous saccharification and fermentation processes. The present sequence is encoded by an integration vector which was introduced into cells to generate recombinant host cells. The vector contains a surrogate promoter from Zymomonas mobilis, the celZ gene from Erwinia chrysanthemi, resistance markers bla and tet, and Klebsiella oxytoca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    bla resistance marker; recombinant host cell; saccharification; fermentation; polysaccharase; oligosaccharide degradation; celZ gene; glucanase; integration vector; pLO12306.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB DB
